

## EX 8 Implement SVM/Decision tree classification techniques

### Aim:

To implement SVM/ Decision Tree classification technique in R Programming

### PROCEDURE:

1. Install R for windows.
2. Install R Studio.
3. Open R Studio and install packages

Thus R studio is set up successfully.

### a.SVM Classification:

#### Program:

# Install and load the e1071 package (if not already installed)

```
if(!requireNamespace("e1071", quietly = TRUE)) {
```

```
  install.packages("e1071")
```

```
}
```

```
library(e1071)
```

# Load the iris dataset

```
data(iris)
```

```
# Inspect the first few rows of the dataset
head(iris)

# Split the data into training (70%) and testing (30%) sets
set.seed(123) # For reproducibility
sample_indices <- sample(1:nrow(iris), 0.7 * nrow(iris))
train_data <- iris[sample_indices, ]
test_data <- iris[-sample_indices, ]

# Fit the SVM model
svm_model <- svm(Species ~ ., data = train_data, kernel = "radial")

# Print the summary of the model
print(summary(svm_model))

# Predict the test set
predictions <- predict(svm_model, newdata = test_data)

# Evaluate the model's performance
confusion_matrix <- table(Predicted = predictions, Actual = test_data$Species)
print(confusion_matrix)

# Calculate accuracy
accuracy <- sum(diag(confusion_matrix)) / sum(confusion_matrix)
cat("Accuracy:", accuracy * 100, "%\n")
```

**OUTPUT:**

```
   Sepal.Length Sepal.Width Petal.Length Petal.Width Species
1           5.1         3.5         1.4         0.2  setosa
2           4.9         3.0         1.4         0.2  setosa
3           4.7         3.2         1.3         0.2  setosa
4           4.6         3.1         1.5         0.2  setosa
5           5.0         3.6         1.4         0.2  setosa
6           5.4         3.9         1.7         0.4  setosa
~
```

```
Call:
svm(formula = Species ~ ., data = train_data, kernel = "radial")
```

```
Parameters:
  SVM-Type:  C-classification
  SVM-Kernel: radial
    cost:    1
```

```
Number of Support Vectors: 45

( 7 18 20 )
```

```
Number of Classes: 3
```

```
Levels:
setosa versicolor virginica
```

```
> # Predict the test set
> predictions <- predict(svm_model, newdata = test_data)
>
> # Evaluate the model's performance
> confusion_matrix <- table(Predicted = predictions, Actual = test_data$Species)
> print(confusion_matrix)
      Actual
Predicted setosa versicolor virginica
setosa      14         0         0
versicolor  0         17         0
virginica   0         1        13
>
> # Calculate accuracy
> accuracy <- sum(diag(confusion_matrix)) / sum(confusion_matrix)
> cat("Accuracy:", accuracy * 100, "%\n")
Accuracy: 97.77778 %
```

## **b. Decision Tree Classification**

### Program:

```
# Install and load the rpart package (if not already installed)
if (!requireNamespace("rpart", quietly = TRUE)) {
  install.packages("rpart")
}

library(rpart)

# Load the iris dataset
data(iris)

# Split the data into training (70%) and testing (30%) sets
set.seed(123) # For reproducibility
sample_indices <- sample(1:nrow(iris), 0.7 * nrow(iris))
```

```
train_data <- iris[sample_indices, ]
test_data <- iris[-sample_indices, ]

# Fit the Decision Tree model
tree_model <- rpart(Species ~ ., data = train_data, method = "class")

# Print the summary of the model
print(summary(tree_model))

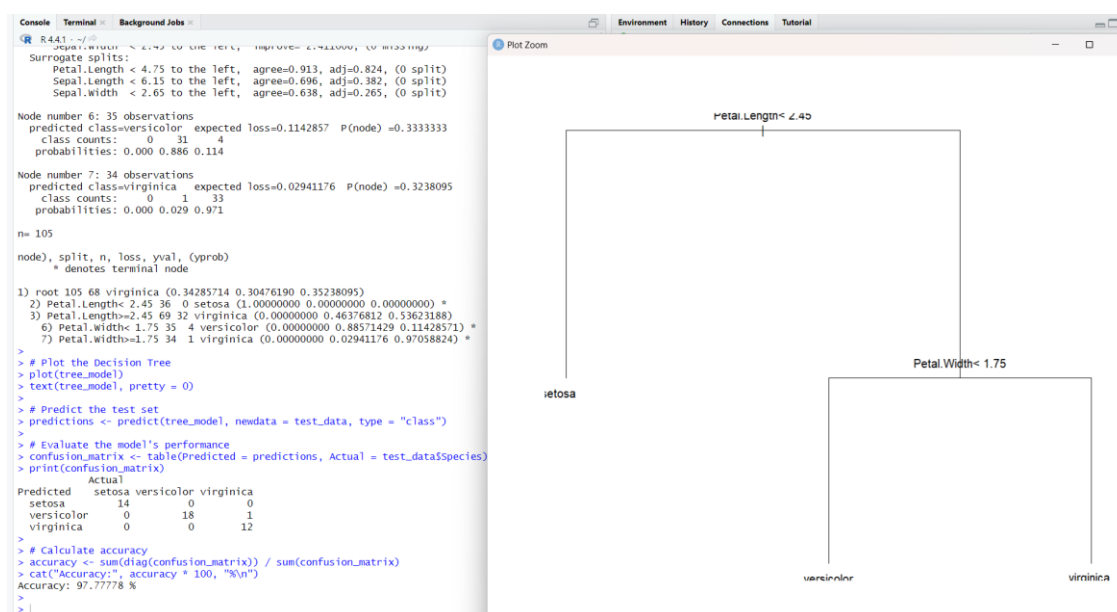

# Plot the Decision Tree
plot(tree_model)
text(tree_model, pretty = 0)

# Predict the test set
predictions <- predict(tree_model, newdata = test_data, type = "class")

# Evaluate the model's performance
confusion_matrix <- table(Predicted = predictions, Actual = test_data$Species)
print(confusion_matrix)

# Calculate accuracy
accuracy <- sum(diag(confusion_matrix)) / sum(confusion_matrix)
cat("Accuracy:", accuracy * 100, "%\n")
```

## OUTPUT:

## Result:

Thus SVM/ Decision Tree classification technique is implemented in R Programming successfully.
